

Your Paper Title: A Clear and Concise Subtitle

First Author¹ and Second Author²

¹Department, First University

²Department, Second University

Abstract

Replace this paragraph with your paper’s abstract. Introduce the problem and the specific gap in existing work, describe the main idea, and summarize the evidence supporting your conclusions. This example demonstrates the template’s typography: a centered title, authors with separate affiliations, and a compact abstract without first-line indentation. The project includes a small set of examples for equations, tables, citations, and code listings. Replace all example content with your own manuscript before publication. Keep the abstract self-contained, state the main findings precisely, and avoid claims that go beyond the evidence in the paper. An optional code-release sentence can be written as: Code will be released at <https://github.com/USERNAME/REPOSITORY>.

1 Introduction

Start with the research problem, explain why it matters, and identify the gap that motivates your contribution. Replace these paragraphs with your manuscript. Paragraphs have no first-line indentation and are separated by a small vertical space.

Use `\citet{knuth1984texbook}` for a citation that forms part of a sentence: Knuth (1984) describes the TeX typesetting system. Use `\citep{knuth1984texbook}` for a parenthetical citation (Knuth, 1984).

Ordinary **bold text**, *emphasis*, and `monospaced text` use the corresponding font styles. Introduce your contributions clearly before presenting their technical details in Section 2.

2 Method

Define the notation and introduce YOURMETHOD. This example equation demonstrates the matching mathematics font and a distribution command with a unique name:

$$y = f_{\theta}(x) + \varepsilon, \quad \varepsilon \sim \text{Laplace}(0, b). \quad (1)$$

Equation 1 is illustrative, not a proposed research method.

2.1 Implementation

Describe the model, data, training procedure, and assumptions needed to reproduce your results. Keep custom mathematics commands in `preamble.tex`; avoid importing an entire legacy macro file unless the paper requires it.

3 Experiments

Describe the evaluation protocol, baselines, and measurements. The table below shows file organization rather than experimental results.

Table 1: The main files in this reusable project.

File	Purpose
<code>main.tex</code>	Title, authors, and section order
<code>arxiv-style.sty</code>	Fonts and page layout
<code>preamble.tex</code>	Packages and paper-specific commands
<code>references.bib</code>	Bibliography entries

4 Conclusion

Summarize the main findings and limitations of your work. Replace the example content, bibliography, and metadata before publishing a new manuscript.

A Additional Details

Add supplementary derivations, implementation details, and additional results here. The appendix starts on a new page after the bibliography.

A.1 Code example

The following listing demonstrates the optional code style; it is not a research implementation.

```
def mean(values):  
    if not values:  
        raise ValueError("values must not  
            be empty")  
    return sum(values) / len(values)
```
